Centrum voor Economische Studiën

Naamsestraat, 69

B-3000 Leuven

1. Aim
2. Policies
3. Method
4. Results
5. Conclusion

1. Aim

- inequality: regained centre stage
- => ? role of gov't? policies?
- use of microsimulation models
- features:
 - ex ante (but retrospective)
 - bird's view: many different policies
 - heterogeneous population => distributional
 - even arithmetic: work incentives

1. Aim

- application: Belgium 1992-2012
- two (important) caveats:
 1. descriptive; not normative/evaluative
 2. not a description of real world changes in distribution, but counterfactuals
 3. two metrics: distribution & incentives
but: \neq eventual equity-efficiency trade-off

1. Aim
2. Policies
3. Method
4. Results
5. Conclusion

2. Policies

2. Policies

2. Policies

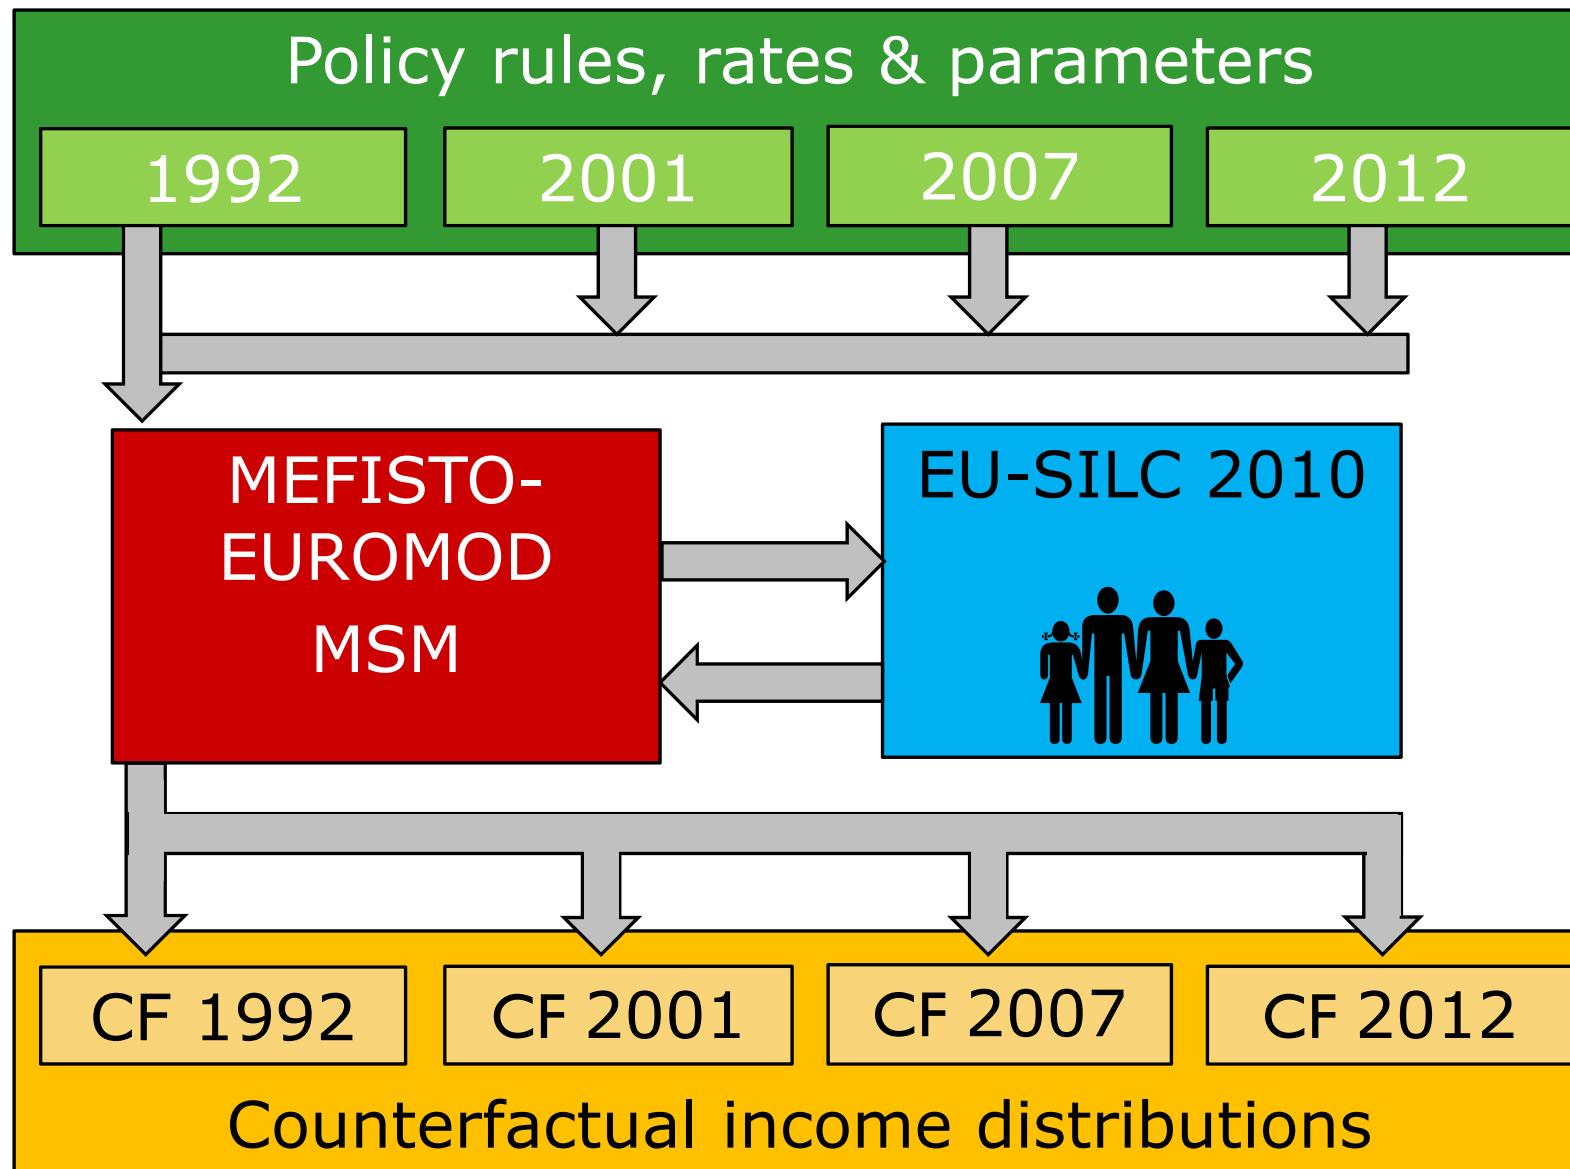

- many more changes, but
- not all policies can be simulated in MSM
 - non cash: public good provision;
 - subsidized public transport
 - subsidized education
 - provision elderly care
 - ...
 - even changes in cash elements
 - eligibility conditions
 - dynamic elements (UB-duration, pension rights, ...)

1. Aim
2. Policies
3. **Method**
4. Results
5. Conclusion

3. Method

1. microsimulation model
2. counterfactual income distribution
3. by changing policy parameters
4. on a given population
5. processing output => 2 metrics

3.1 Method: MSM

3.1 Method: MSM-caveat nr. 1

- counterfactual income distribution
- real world changes in income distribution:
 1. changes in gross incomes
(return to education, technology, globalisation)
 2. changes in socio-demographic situation
(more singles, lone parents, ageing, ...)
 3. policy
(taxes, benefits, non cash policies, ...)

3.1 Method: MSM-caveat nr. 1

- counterfactual income distribution
- real world changes in income distribution:
 1. changes in gross incomes
(return to education, technology, globalisation)
 2. changes in socio-demographic situation
(more singles, lone parents, ageing, ...)
 3. **policy**
by **simulating counterfactuals**
- Bargain and Callan (2010)

3.1 Method: MSM-caveat nr. 1

- Bargain and Callan (2010)
- disposable income for h in year t :

$$y_h^t = d^t(\mathbf{p}^t, \mathbf{x}_h^t, \mathbf{z}_h^t)$$

tax benefit system

nominal parameters tax benefit system

gross incomes

socio-demographic characteristics

$$y_h^0 = d^0(\mathbf{p}^0, \mathbf{x}_h^0, \mathbf{z}_h^0)$$

3.1 Method: MSM-caveat nr. 1

- B&C decompose actual change:

$$y_h^t - y_h^0 = d^t(\mathbf{p}^t, \mathbf{x}_h^t, \mathbf{z}_h^t) - d^0(\mathbf{p}^0, \mathbf{x}_h^0, \mathbf{z}_h^0)$$

$$= \underbrace{d^t(\mathbf{p}^t, \mathbf{x}_h^t, \mathbf{z}_h^t) - d^0(\pi \cdot \mathbf{p}^0, \mathbf{x}_h^t, \mathbf{z}_h^t)}_{\text{effect of policy}}$$

effect of policy

$$+ \underbrace{d^0(\pi \cdot \mathbf{p}^0, \mathbf{x}_h^t, \mathbf{z}_h^t) - d^0(\pi \cdot \mathbf{p}^0, \pi \cdot \mathbf{x}_h^0, \mathbf{z}_h^0)}_{\text{effect of gross income \& demogr. change}}$$

effect of gross income & demogr. change

$$+ \underbrace{d^0(\pi \cdot \mathbf{p}^0, \pi \cdot \mathbf{x}_h^0, \mathbf{z}_h^0) - d^0(\mathbf{p}^0, \mathbf{x}_h^0, \mathbf{z}_h^0)}_{\text{nominal fiscal drag}}$$

nominal fiscal drag

3.1 Method: MSM-caveat nr. 1

- B&C decompose actual change:

$$y_h^t - y_h^0 = d^t(\mathbf{p}^t, \mathbf{x}_h^t, \mathbf{z}_h^t) - d^0(\mathbf{p}^0, \mathbf{x}_h^0, \mathbf{z}_h^0)$$

$$\neq d^t(\mathbf{p}^t, \mathbf{x}_h^t, \mathbf{z}_h^t) - d^0(\pi \cdot \mathbf{p}^0, \mathbf{x}_h^t, \mathbf{z}_h^t)$$

effect of policy

- only counterfactual
- dependent on SILC 2010
- default: full indexation of parameters
 - non-indexation = discretionary policy

3.1 Method: MSM-caveat nr. 2

- not all policies are simulated
- three cases
 1. policy parameterized in MSM
 - e.g. PIT, child benefits, minimum income, VAT, ...
 2. policy not parameterized
 - e.g. pensions, unemployment benefits, ...
 3. policy not simulated
 - degressivity UB, maximum billing, ...
 - withholding tax on capital income, ...
 - all “non cash” policy changes

3.1 Method

- despite the two caveats:
- informative description of policy orientation
- by means of two measures
 - equity (or: distributional effect)
 - efficiency (or: effect on work incentives)

3.2 Method: measuring equity

- distribution **gains/losses** due to Δ policy
 - by income group (deciles)
 - by subgroups of age, household composition, labour market status, ...
- **redistributive power** T&B-system
 - compares inequality before and after T&B
 - can be decomposed in

Redistribution = average tax \times progressivity

$$G^1 - G^0 \approx \frac{t}{1-t} \times P$$

3.3 Method: measuring incentives

- efficiency = **cost of distortion** TB-system
- redistribution and/or collecting R is not lump sum but distortionary
=> welfare cost (Excess Burden)
- three elements (see e.g. Saez et al.):
 - marginal tax rates
 - behaviour (here: labour supply elasticity)
 - empirical distribution

3.3 Method: measuring incentives

- role of marginal tax rates:
 - **intensive** margin (working more): METR's

$$m_h = 1 - \frac{d(1.05 * x_h) - d(x_h)}{0.05 * x_h} \quad (\text{elasticity : } \varepsilon_h)$$

- **extensive** margin (participating or not): PTR's

$$\tau_h = 1 - \frac{d(x_h^{\text{in work}}) - d(x_h^{\text{out work}})}{x_h^{\text{in work}}} \quad (\text{elasticity : } \eta_h)$$

mostly larger, important for lower wages/education

3.3 Method: measuring incentives

- three elements welfare cost of distortion:
 - marginal tax rate
 - behaviour (labour supply elasticity)
 - empirical distribution

- appear in formula for **MCPF**
 (= **deadweight loss** tax-benefit system)
 - compares with lump sum tax or benefit
 - use: controversial, lot of debate
 - here: **descriptive device** of distribution of MTR's in a heterogeneous population

3.3 Method: measuring incentives

- MCPF calculated as (Kleven & Kreiner):

$$MCPF = \frac{1}{\sum_{i=1}^{10} \left[1 - \frac{m_i}{1-m_i} \varepsilon_i - \frac{\tau_i}{1-m_i} \eta_i \right] s_i}$$

- elasticities:
 - from Belgian LS-model (estimated on SILC)
 - from literature (Kleven & Kreiner 2006)

3.3 Method: measuring incentives

- Elasticities (Kleven & Kreiner 2006)

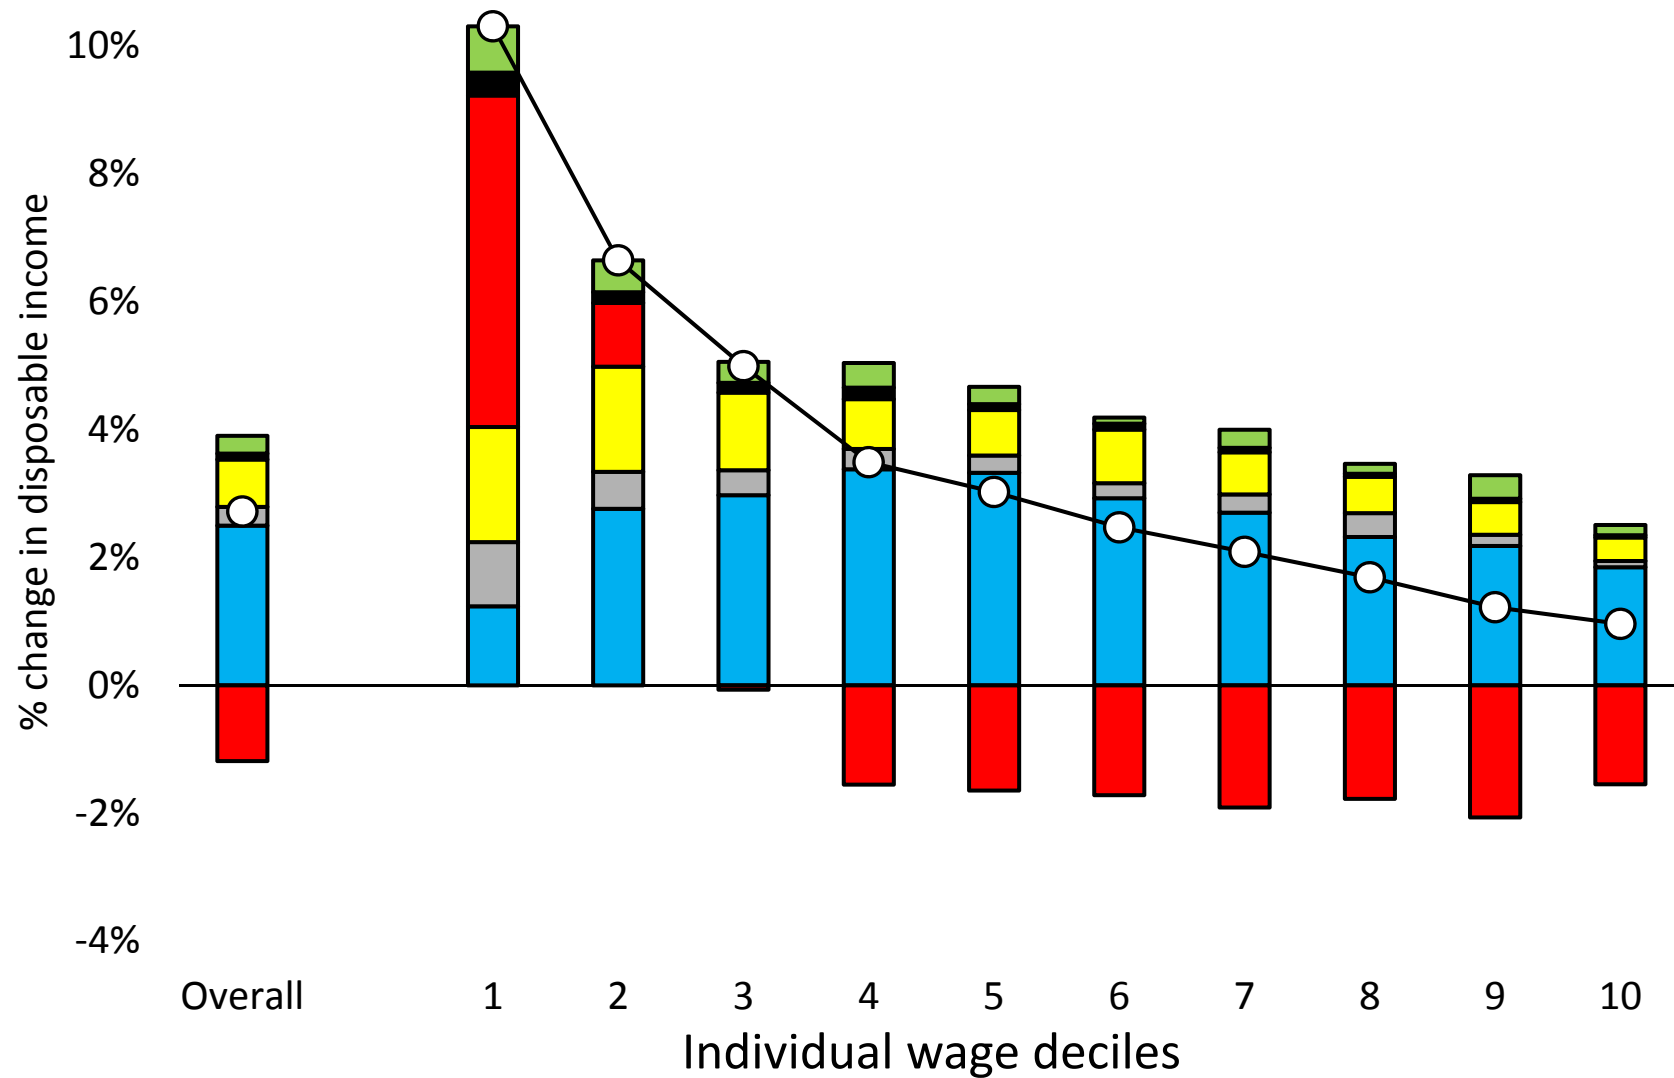

Quintile	Elasticity at the intensive margin	Elasticity at the extensive margin
Q1	0.1	0.4
Q2	0.1	0.3
Q3	0.1	0.2
Q4	0.1	0.1
Q5	0.1	0

1. Aim
2. Policies
3. Method
4. **Results**
5. Conclusion

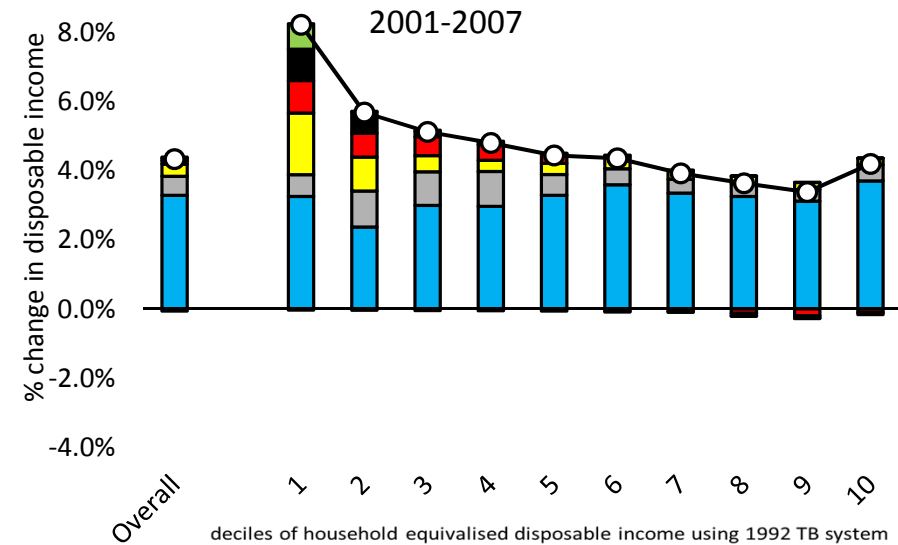

4.1 Redistribution (1): total population

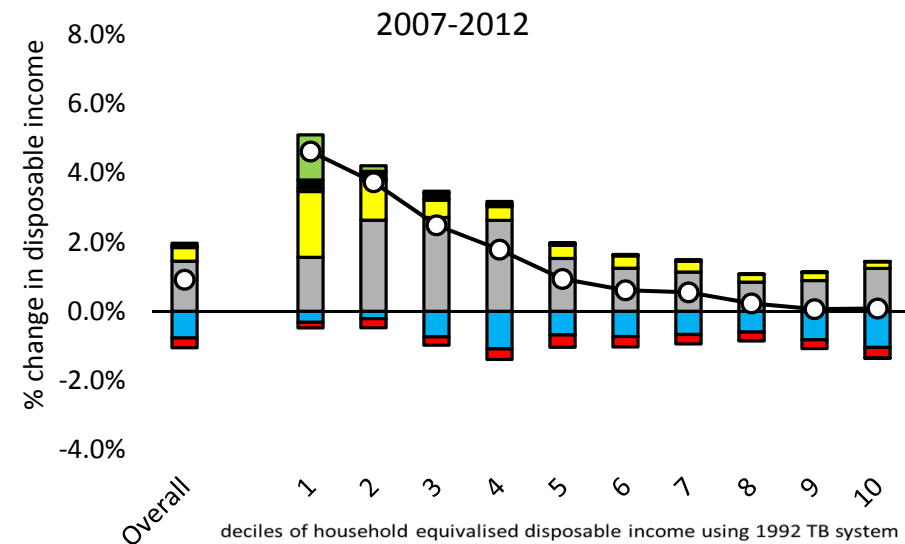

4.1 Redistribution (2): active population

4.1 Results: Redistribution (4)

- Personal income tax
- Pensions
- Unemployment benefits
- Social insurance contributions
- Indirect Taxes
- Family benefits
- Social assistance
- Disposable income

4.1 Results: Redistribution (5)

Redistribution and progressivity

	1992	2001	2007	2012
RS	9.9	10.4	11.0	11.4
P	27.4	26.9	32.3	33.9
Av. tax rate	30.9	32.3	29.4	29.3

4.1 Results: Redistribution (6)

Kakwani index

	1992	2001	2007	2012
All	27.4	26.9	32.3	33.9
PIT	13.3	13.4	16.3	16.7
SIC	0.6	2.5	2.9	3.3
Repl.inc.	-95.6	-95.6	-95.9	-96.1
Benefits	-18.8	-17.9	-19.3	-19.6

4.1 Results: Redistribution (7)

Average tax rate

	1992	2001	2007	2012
All	30.9	32.3	29.4	29.3
PIT	30.5	31.6	28.6	28.7
SIC	14.4	14.9	15.0	15.0
Repl.inc.	-4.7	-4.7	-5.0	-5.3
Benefits	-10.4	-10.4	-10.2	-10.3

4.1 Results: Redistribution (8)

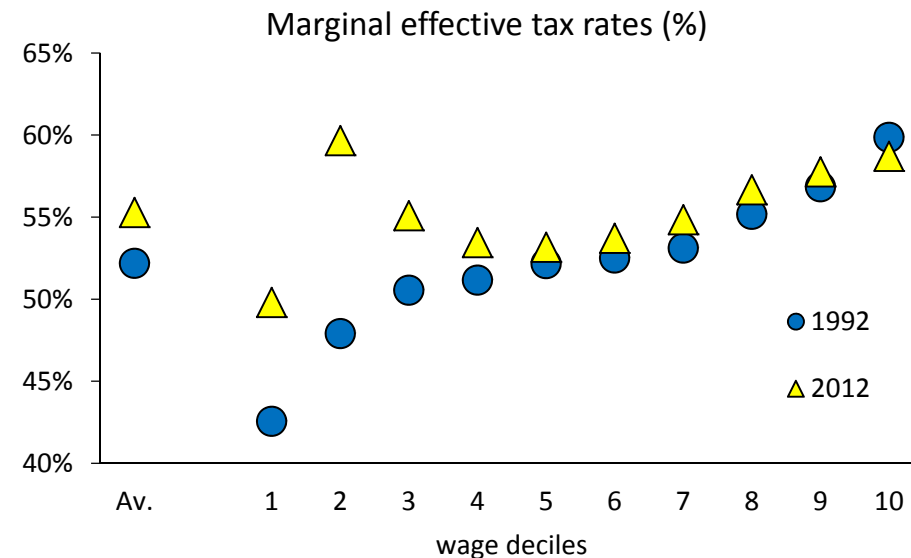

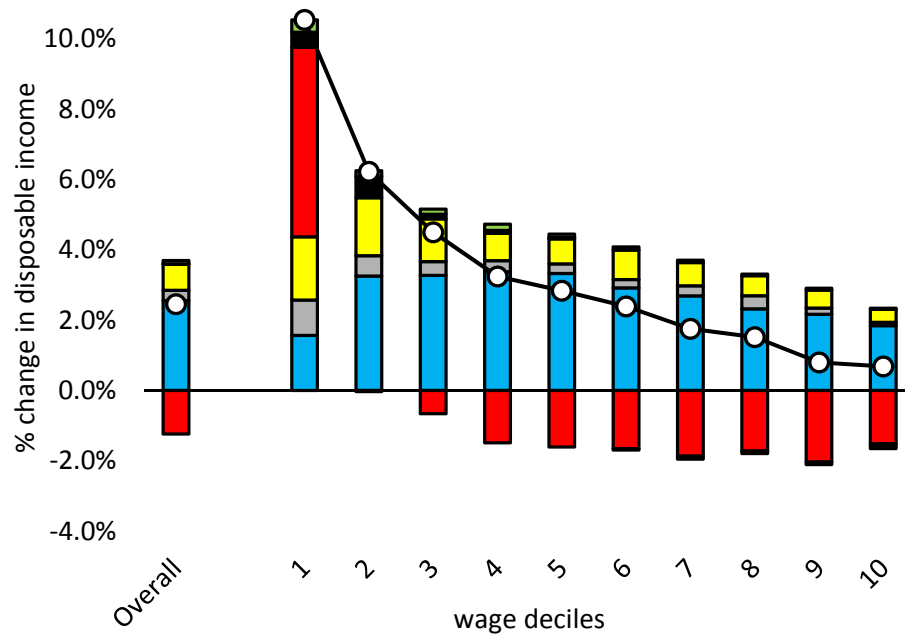

Reynolds Smolensky

	1992	2001	2007	2012
All	9.9	10.4	11.0	11.4
PIT	5.5	5.8	6.2	6.3
SIC	-0.2	0.1	0.2	0.3
Repl.inc.	3.4	3.4	3.6	3.8
Benefits	0.6	0.5	0.6	0.6

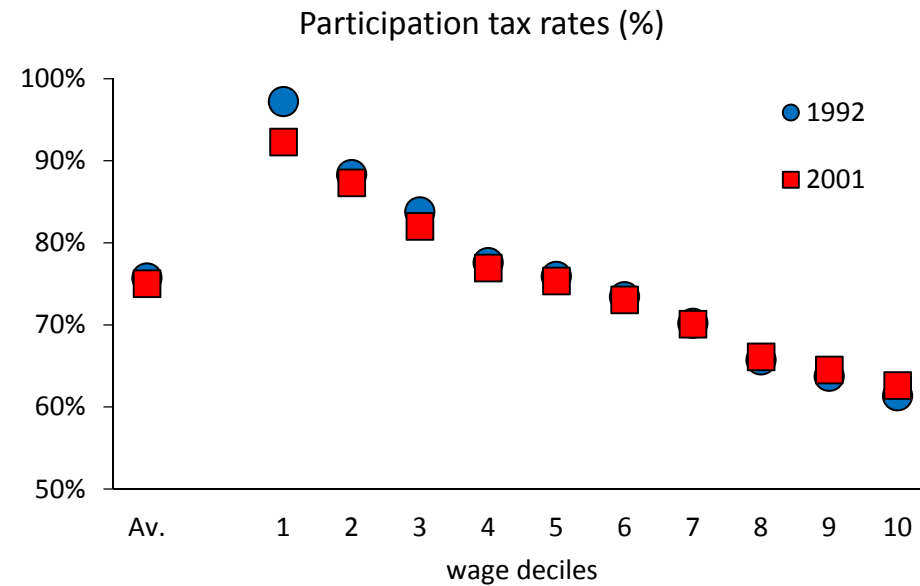

4.2 Results: Work Incentives '92-'12

4.2 Results: Work Incentives '92-'12

4.2 Results: Work Incentives '92-'01

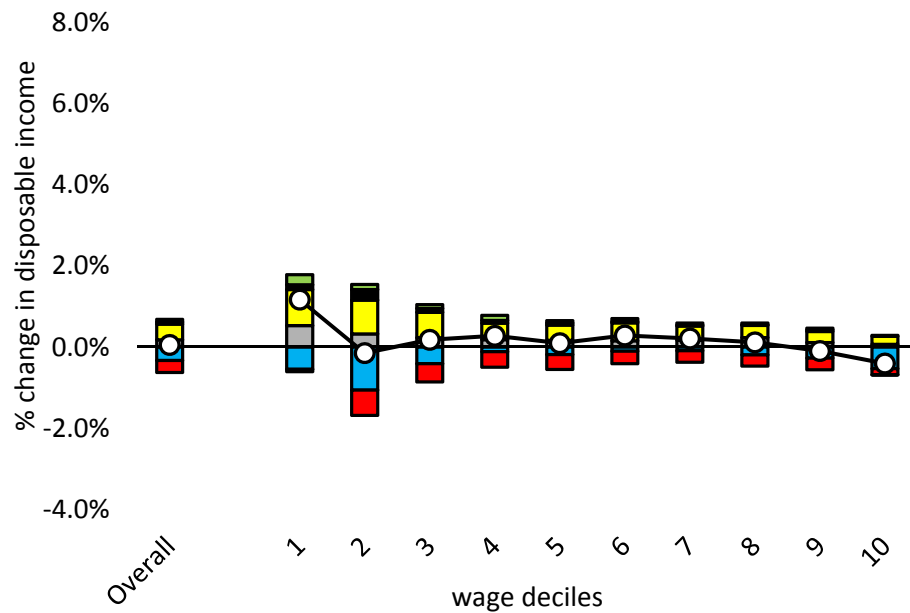

4.2 Results: Work Incentives '01-'07

- Social assistance
- Family benefits
- Social insurance contributions
- Unemployment benefits
- Pensions
- Personal income tax
- Disposable income

4.2 Results: Work Incentives '07-'12

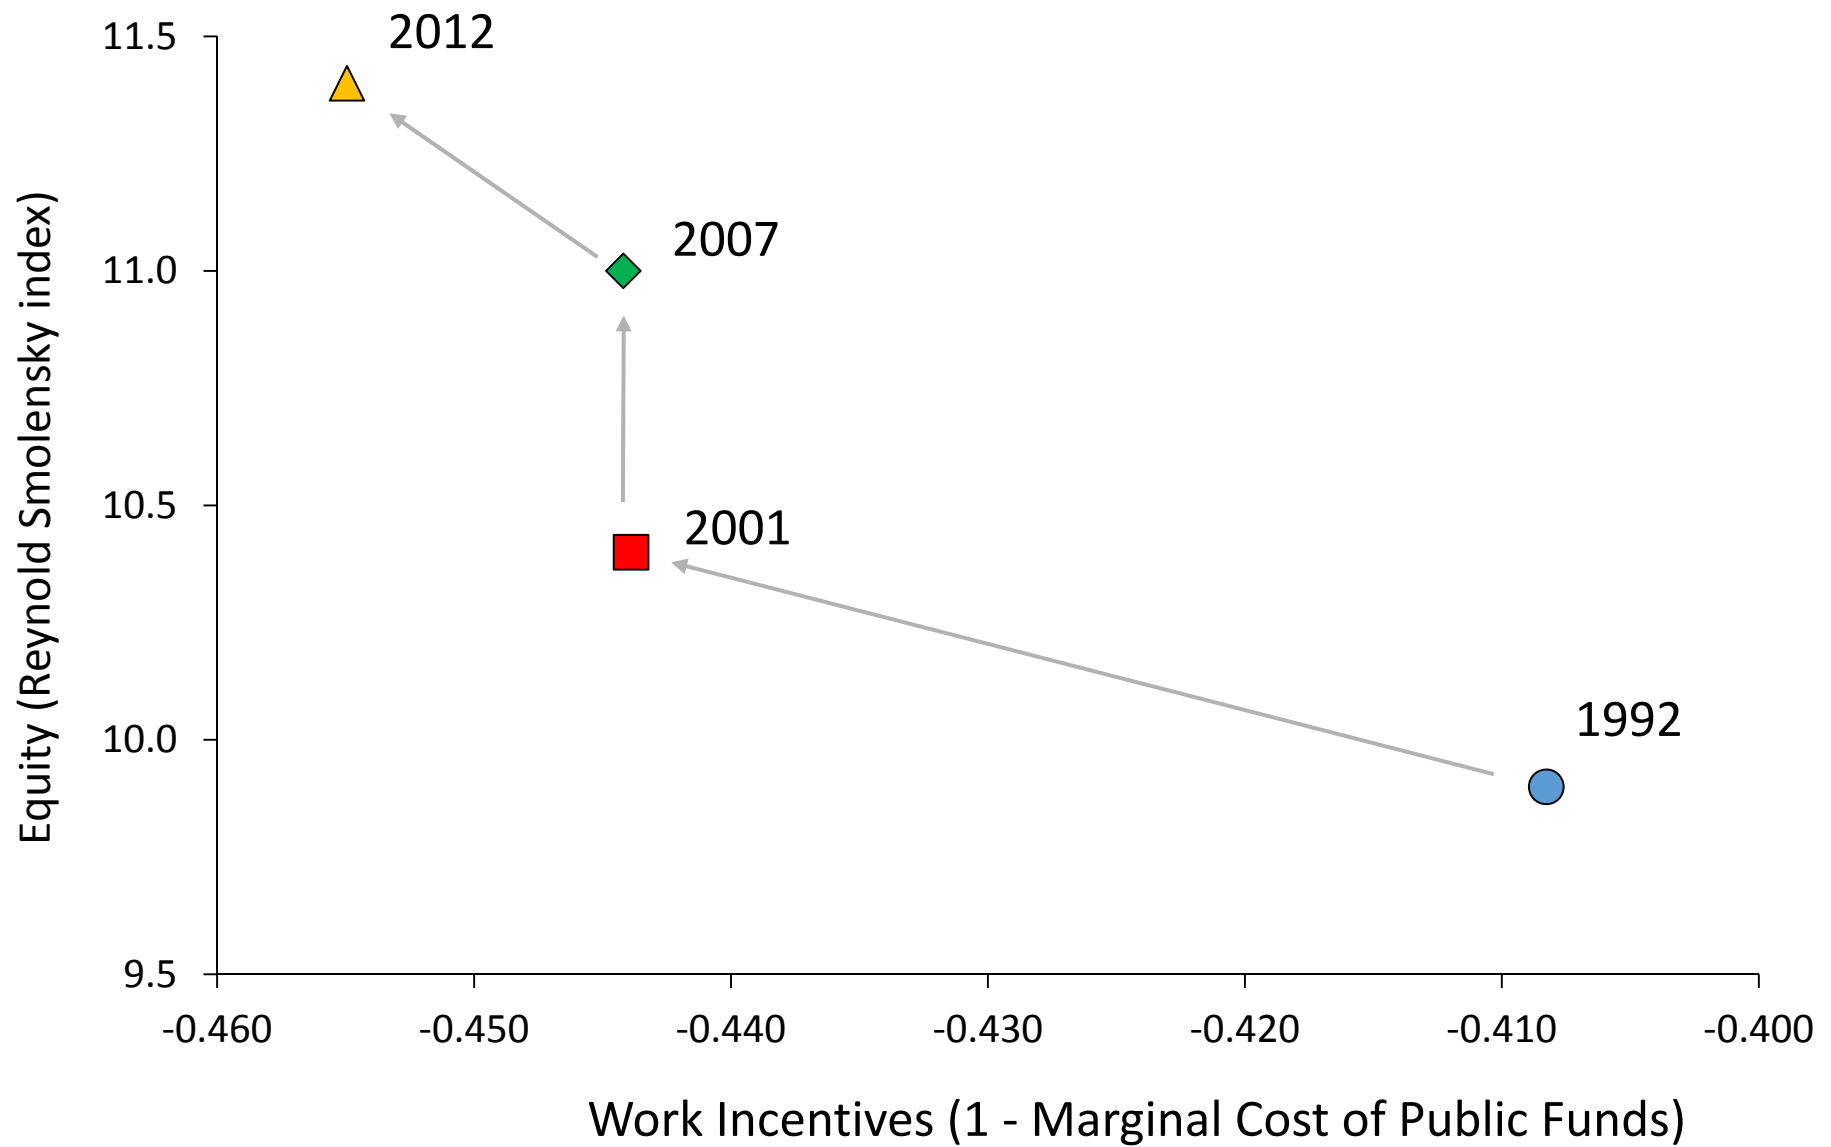

4.2 Results: MCPF

Marginal cost of public funds

1992	2001	2007	2012
1.408	1.444	1.444	1.455

$$MCPF = \frac{1}{\sum_{i=1}^{10} \left[1 - \frac{m_i}{1-m_i} \varepsilon_i - \frac{\tau_i}{1-m_i} \eta_i \right] s_i}$$

4.3 Results: policy shift?

1. Aim
2. Policies
3. Method
4. Results
5. Conclusion

- policy last 2 decades: has put equity first
 - fiscal consolidation 90's: progressive
 - bottom incomes: tax decrease 2001-2007
 - UB increase 2001-2007
 - pension benefit increase 2007-2012
- at the incentive side:
 - PTR's have decreased, thanks to WorkBonus
 - fading out reflected in higher MTR's
 - overall: MTR slightly increased

Conclusion (2)

- if inequality has (slightly) increased
- probably not due to tax benefit policies

or

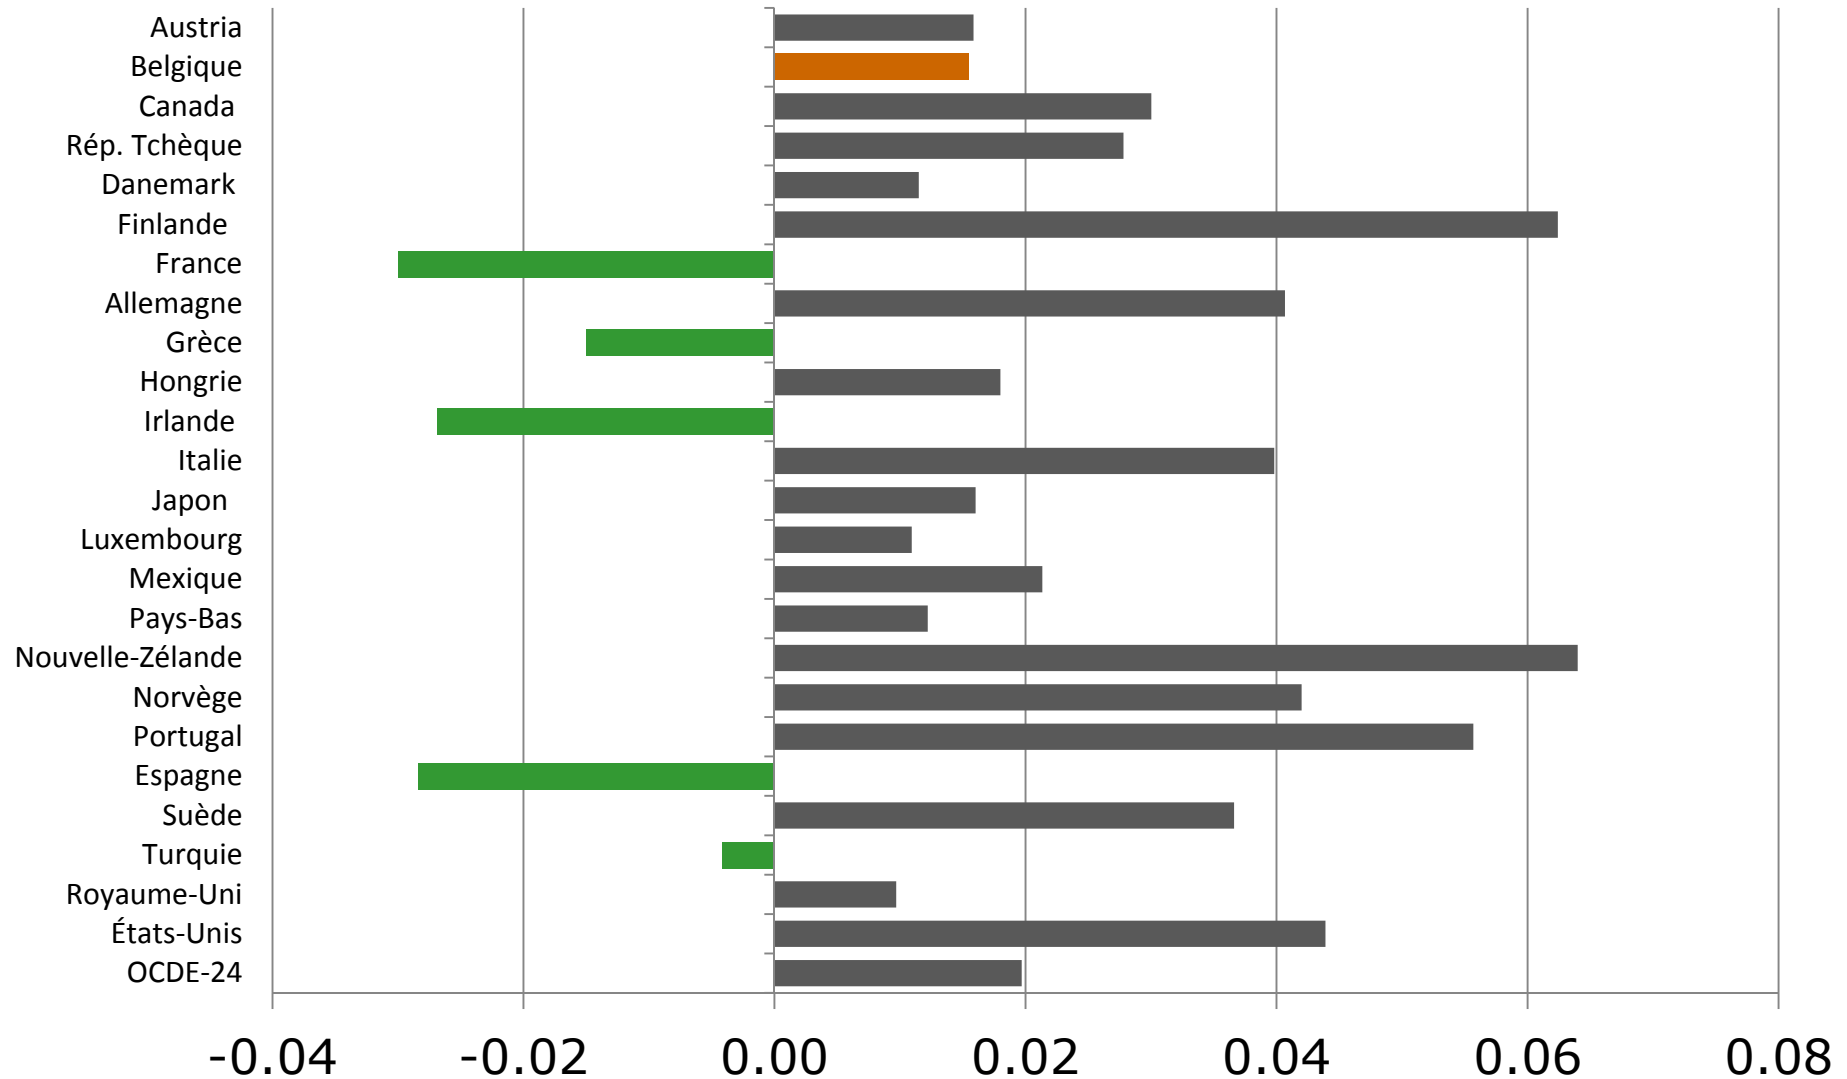

- with less equity-concerned TB-policies
- inequality in disposable income might have increased much more

- use labour supply elasticities of own estimated model
- introduce dynamic elements
 - dependence of UB on duration of U-spell
 - build-up of pensions rights
 - in general: eligibility
 - take-up of subsistence income (Leefloon)

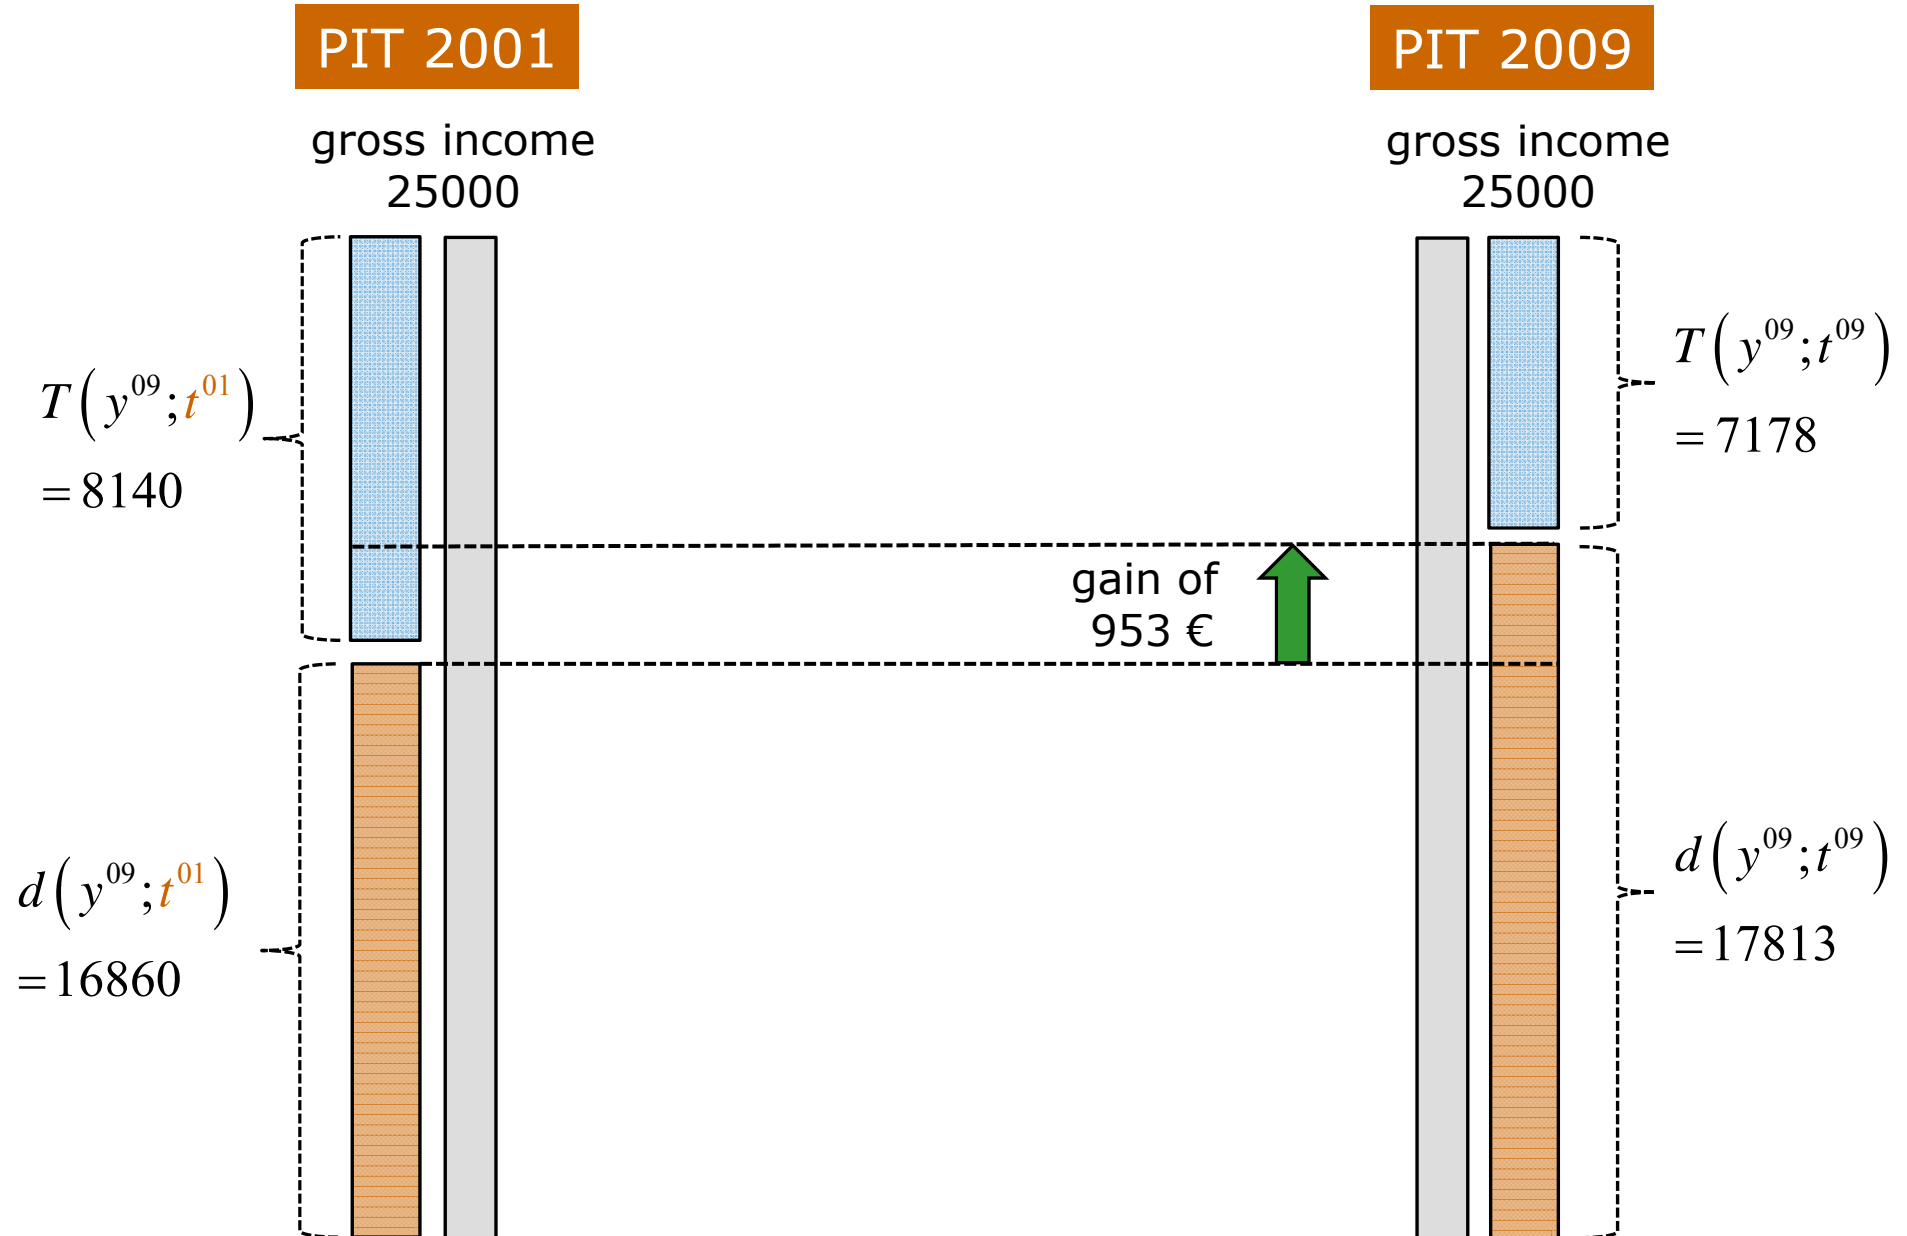

Thank you for your
attention
